HIV reservoir microenvironment

HIV silence / re-activation:
Intrinsic vs microenvironment factors

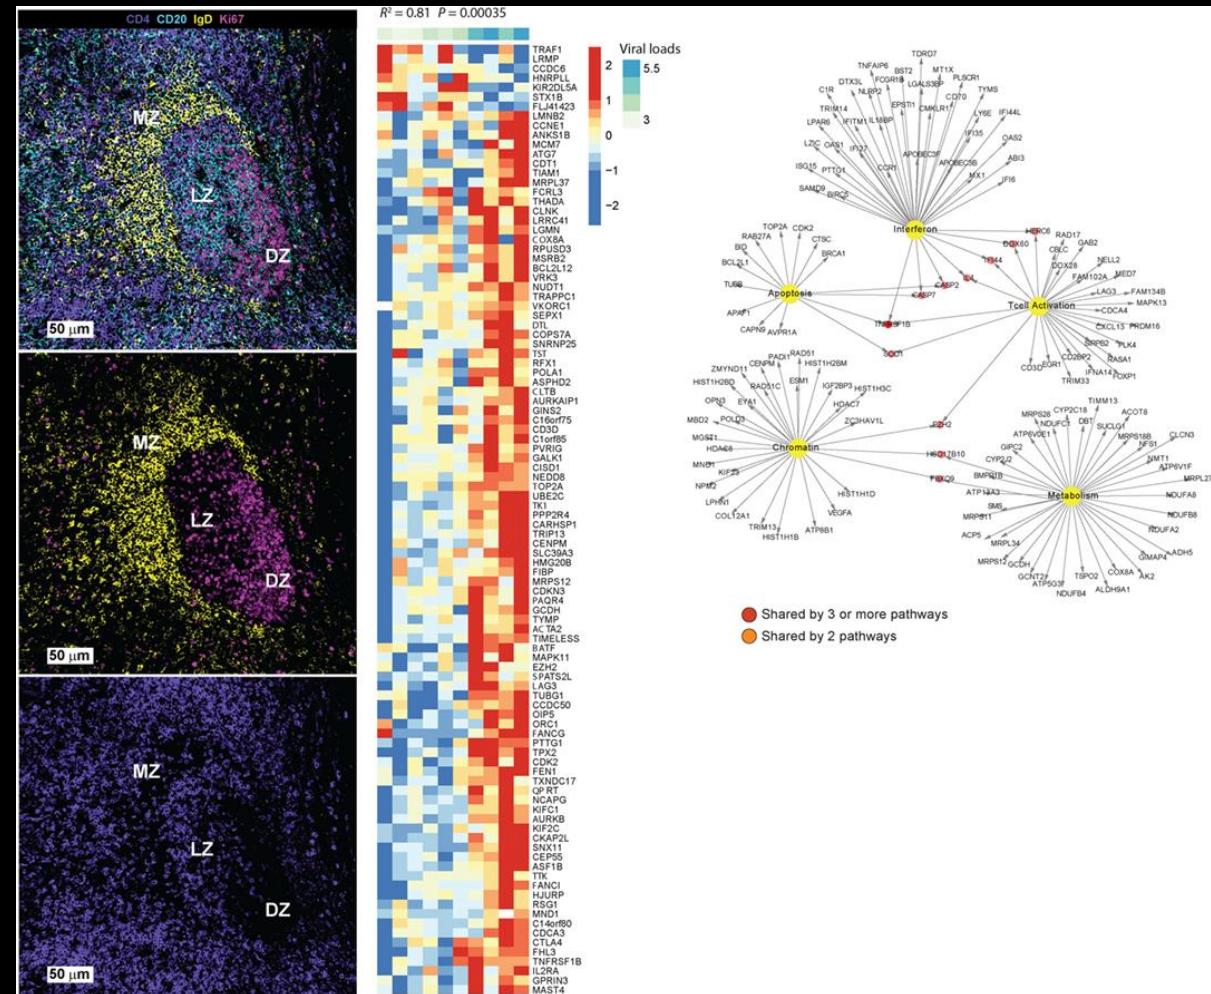

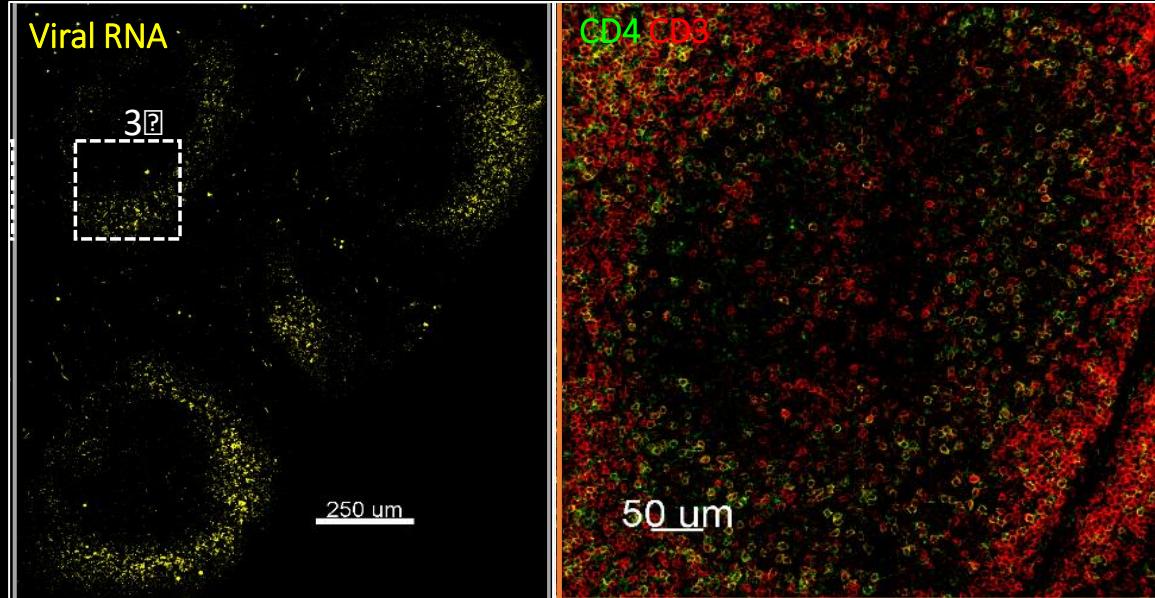

1. Microenvironment varies among different
 - i) tissues (even LNs)
 - ii) areas within the same tissue
2. In situ effector (CTLs, NKs) mechanisms are also different between areas/tissues

Lymph Nodes: a major HIV reservoir anatomical site

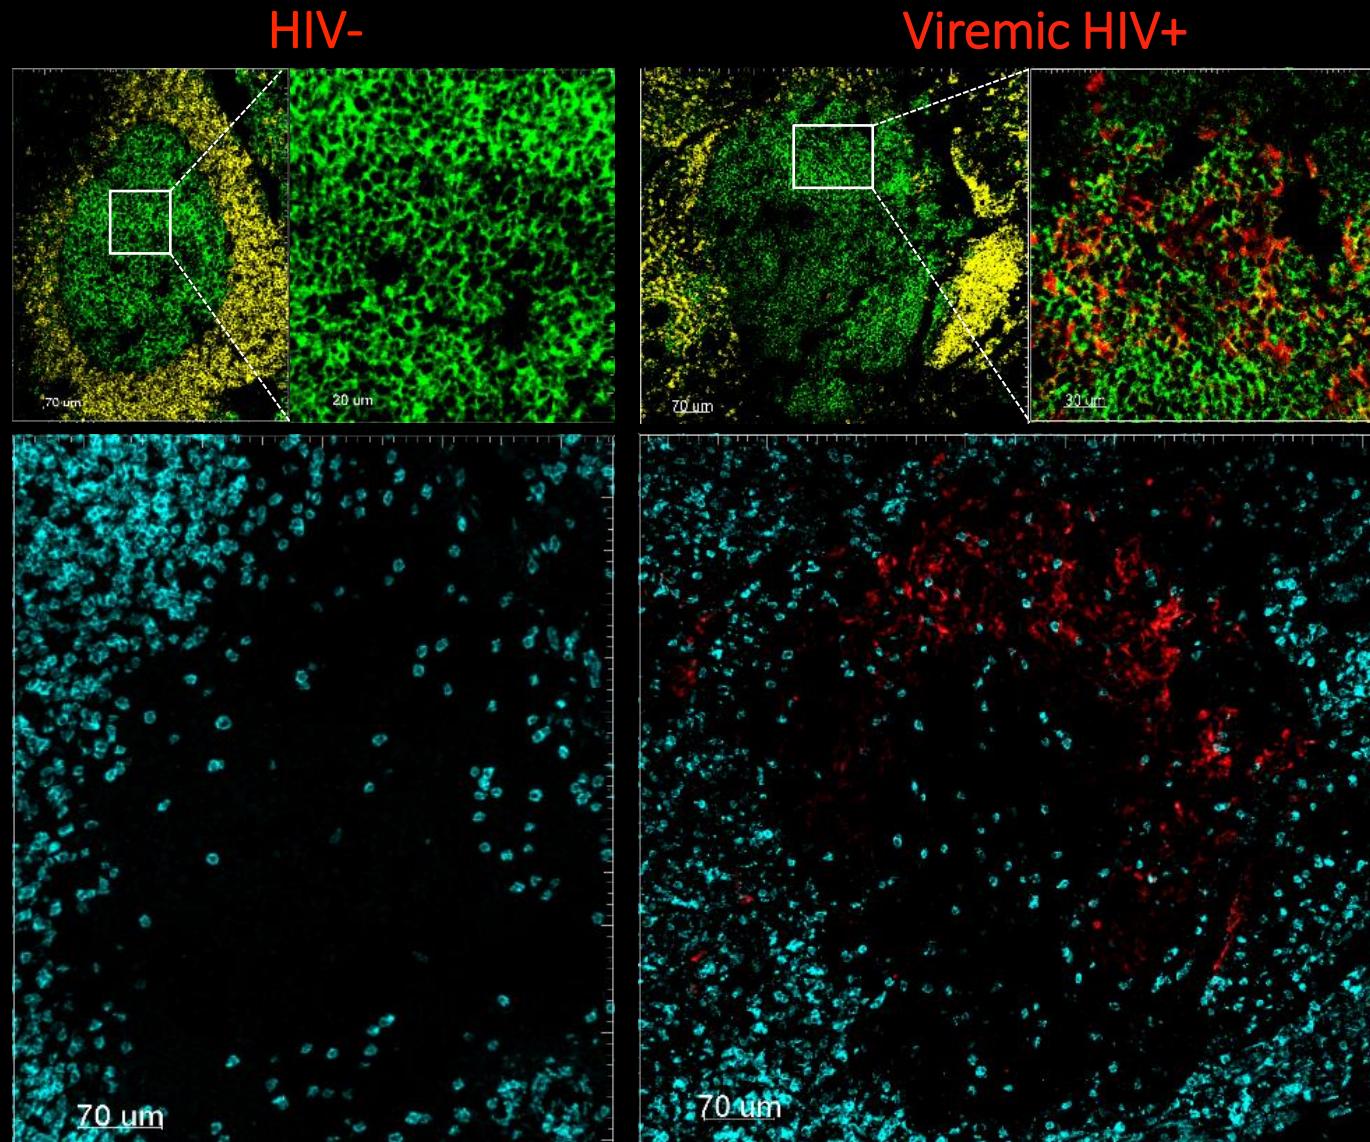

T_{FH} cells hold actively transcribed and latent virus

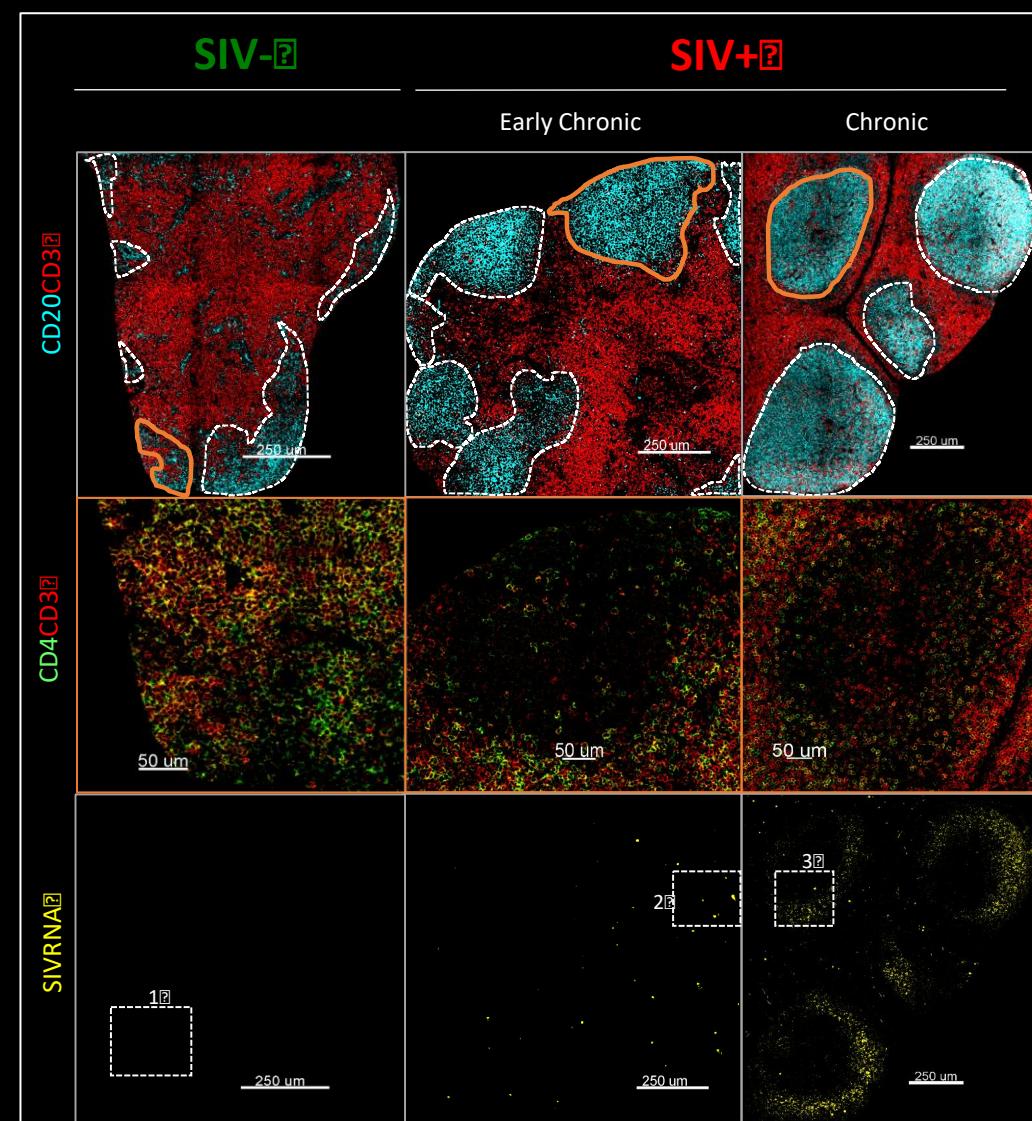

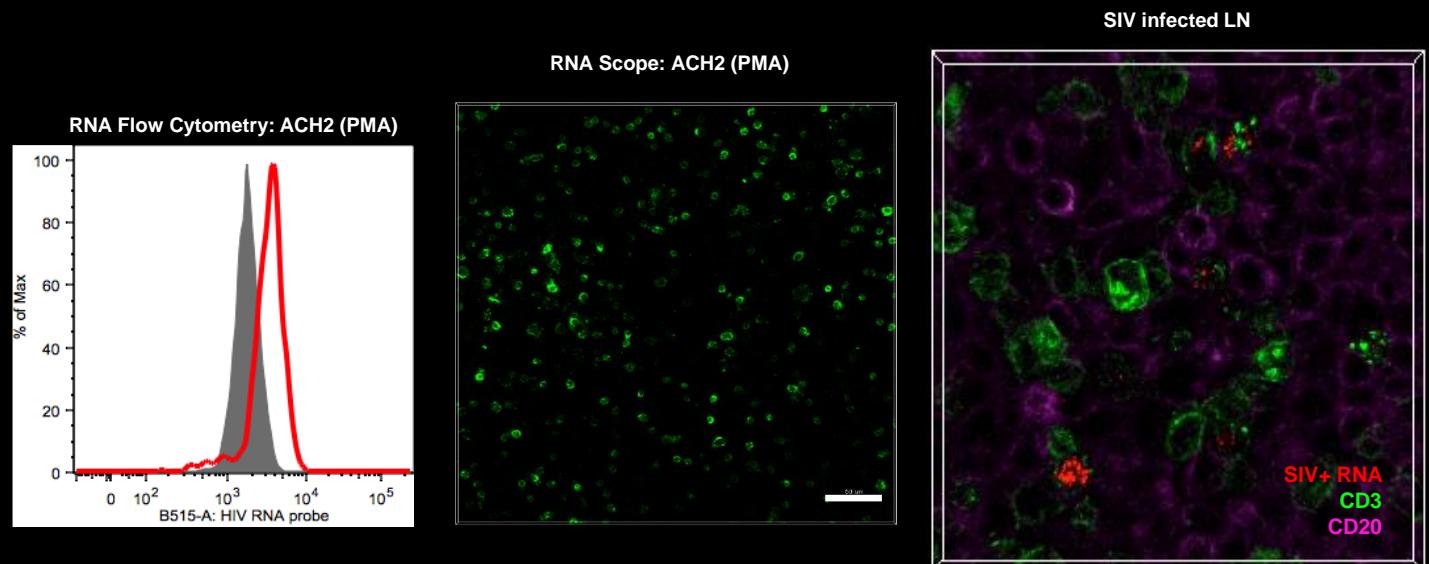

TFH gene signature correlated to viral load

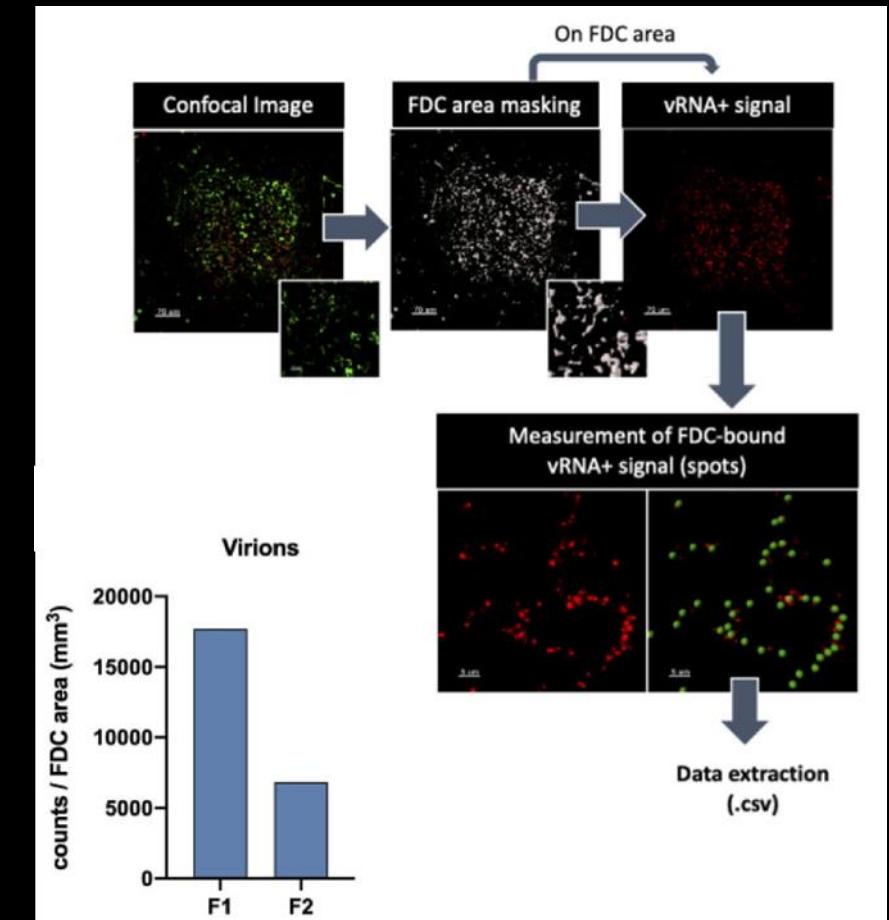

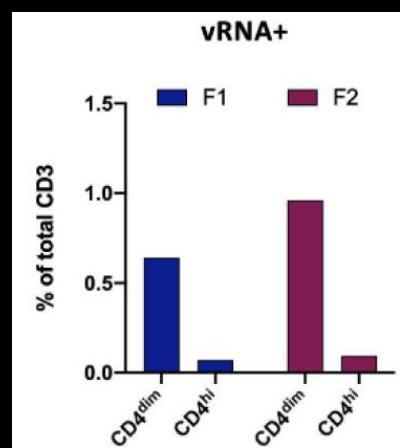

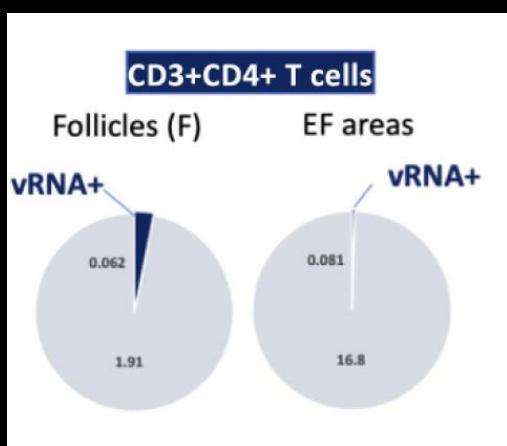

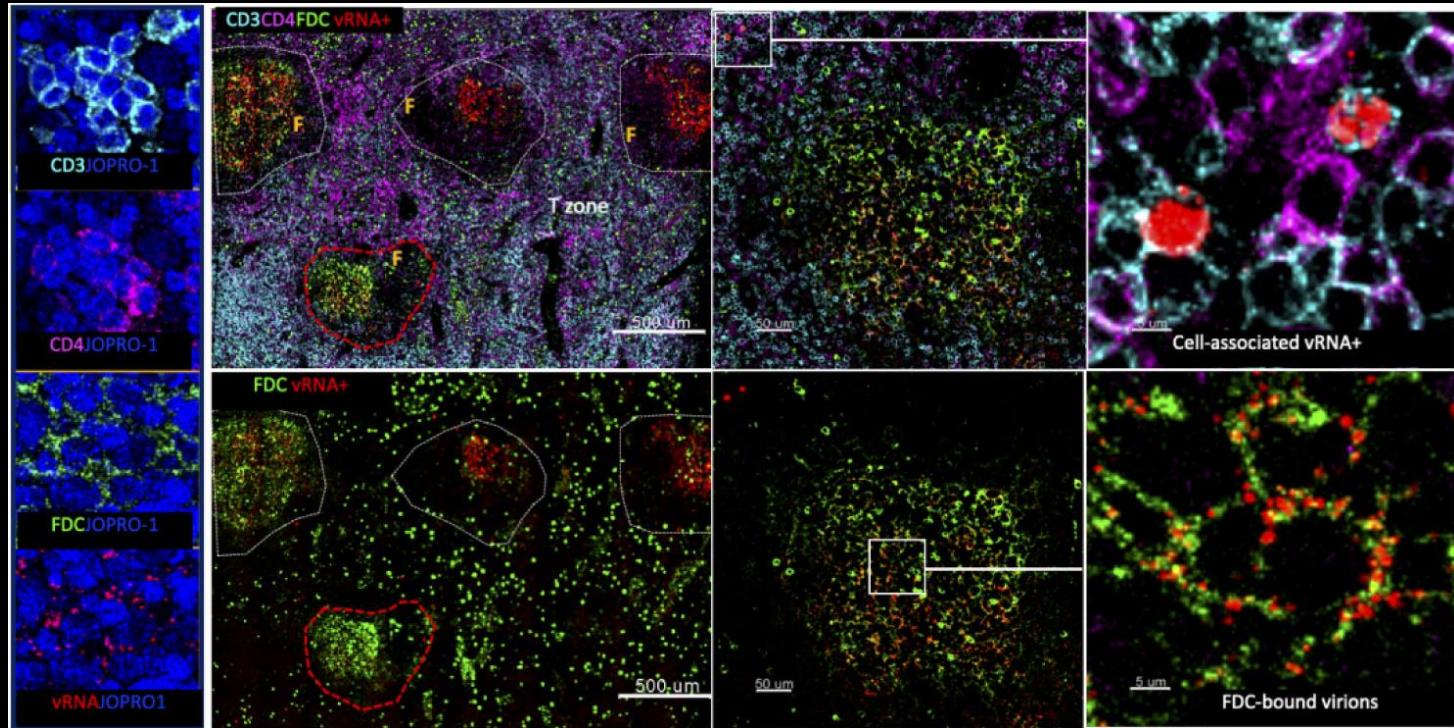

Follicular CD8 T cells as a component of viral reservoir microenvironment

Detection of the virus: RNAscope

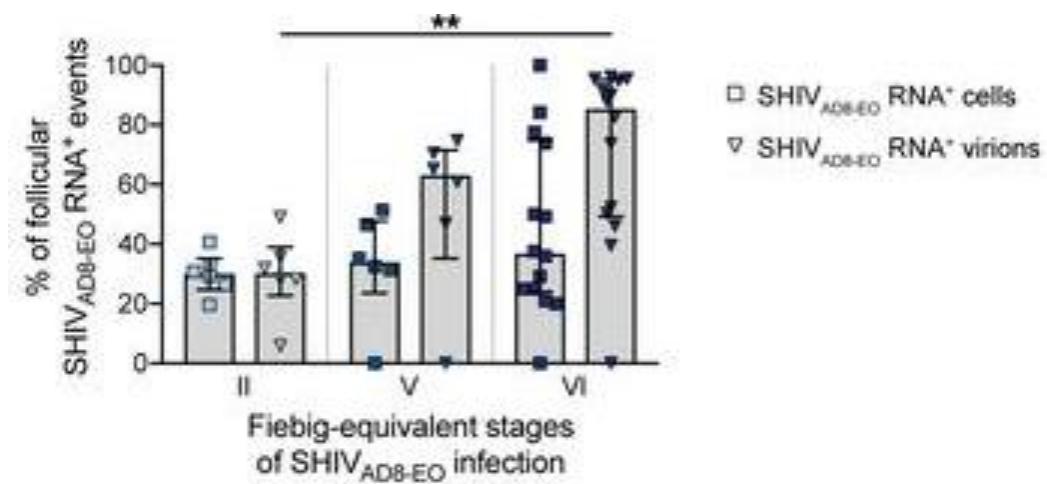

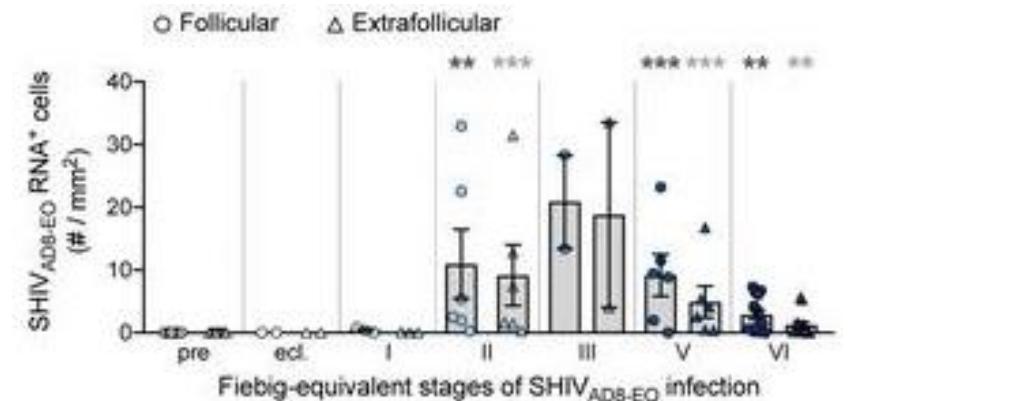

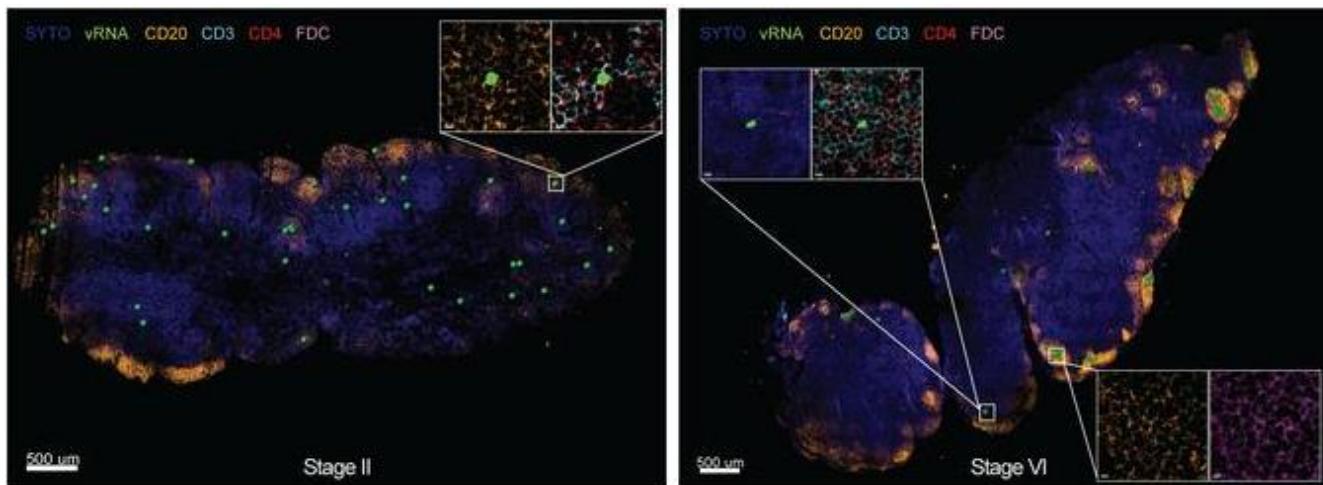

Lymph Nodes: enumerating actively transcribed virus (virions / cells)

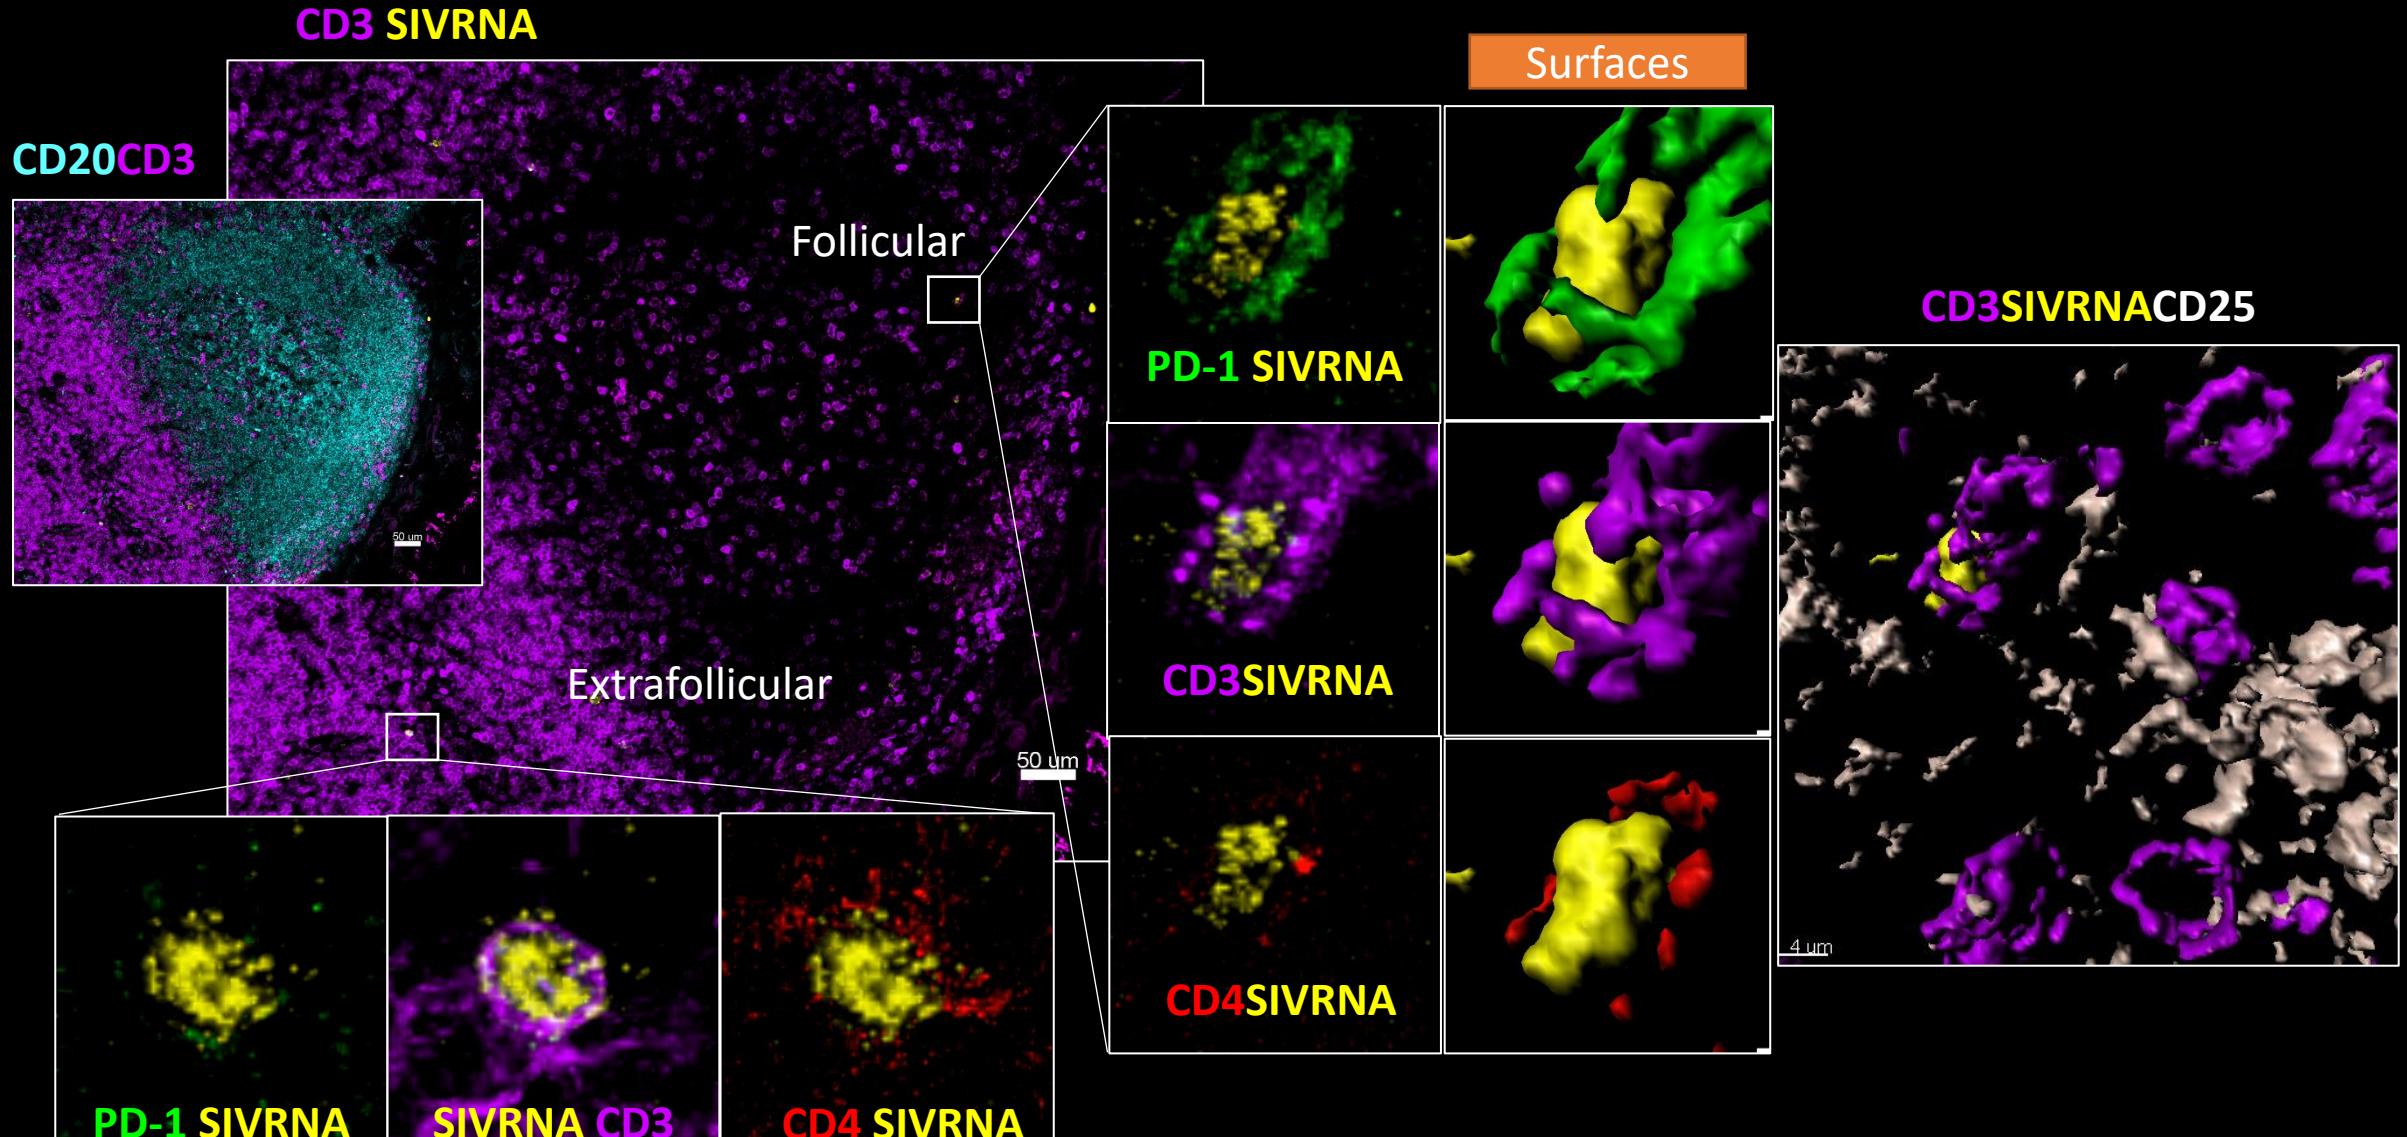

Lymph Nodes: enumerating actively transcribed virus (virions / cells)

Combining mRNA and protein detection for the identification of HIV/SIV infected cells at tissue level

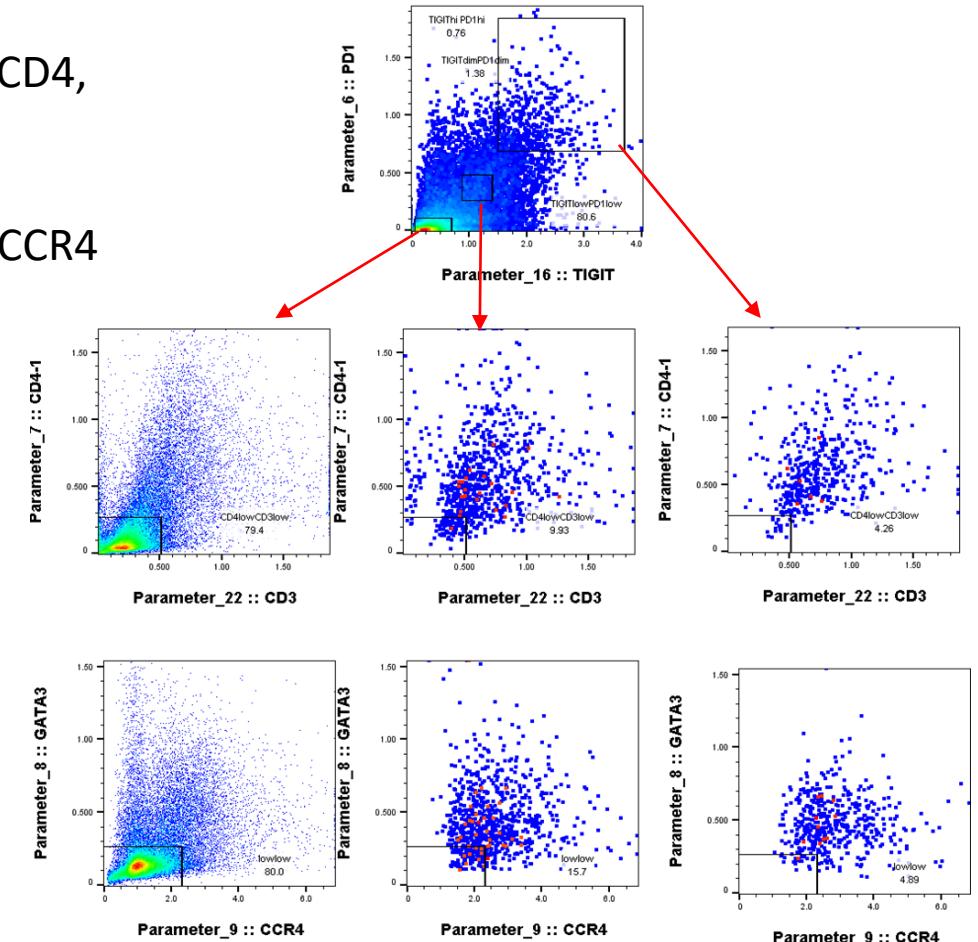

Development of ‘big’ imaging panels for characterization of CD4 T cells and surrounding environment

Constructing imaging panels allowing for the in depth characterization of:
CD4 T cells,
CD8 T cells and
innate immunity cells

Cy1: PD1, CD4,
GATA3
Cy2: TIGIT
Cy3: CD3, CCR4

Connecting *in situ* Phenotype with cell morphological characteristics (especially for innate immune cells in the HIV reservoir microenvironment)

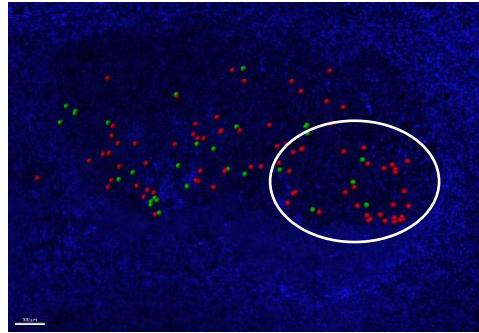

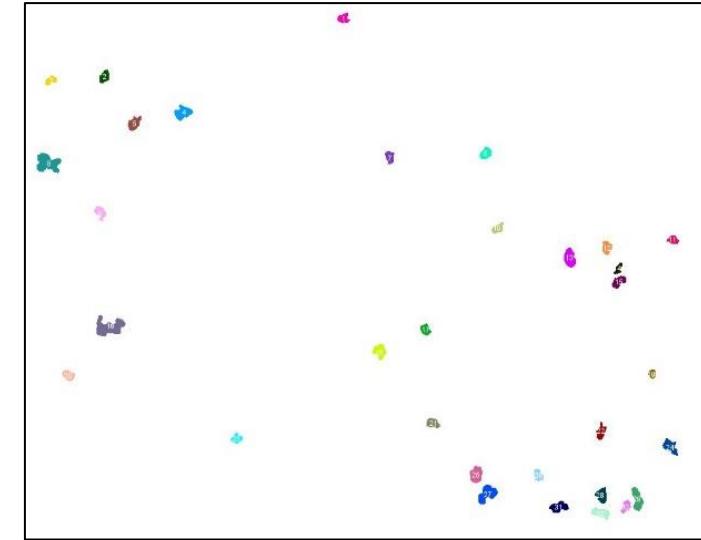

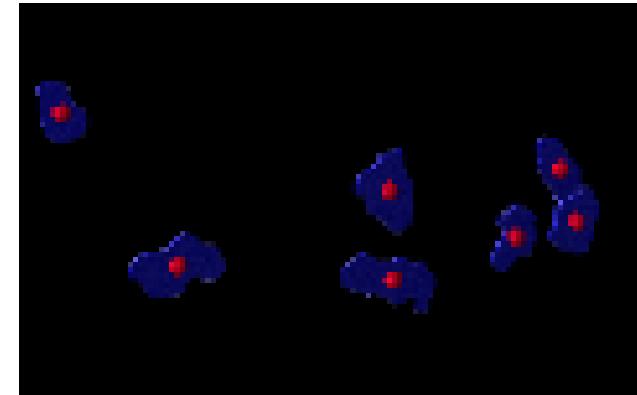

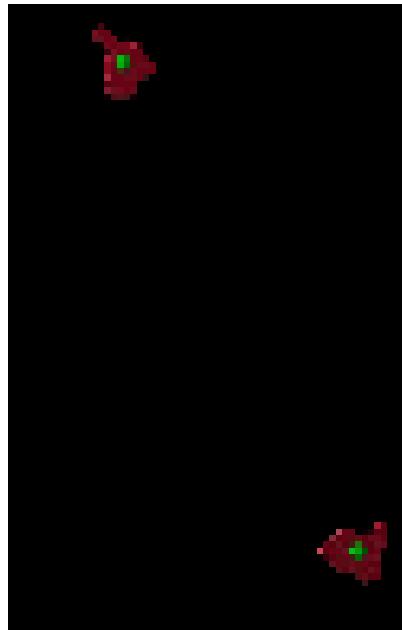

Image J

Development of ‘big’ imaging panels for characterization of CD4 T cells and surrounding environment

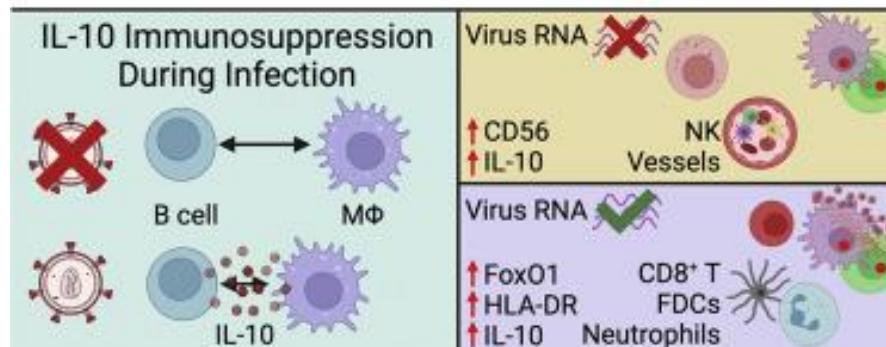

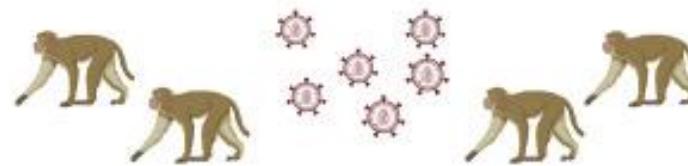

Focus 1: comprehensive characterization of CD4 T cells

Focus 2: aiming the surrounding cells
